AMENDMENTS TO THE SPECIFICATION

Please cancel the Abstract and replace it with the following:

In one embodiment, an analytical system for generating and accessing arguments is disclosed. Each argument is associated with a conclusion indicating whether a particular situation will likely have a negative or positive result. One embodiment of the analytical system includes a database for storing a plurality of templates, each template including a plurality of questions which may be answered to generate a particular argument having an associated conclusion that is based on those answers. The analytical system also includes an argument server that includes means for a user to select a template that is most relevant to a particular situation, means for receiving answers to one or more of the selected template's questions such that a new argument is generated having a conclusion based on those answers, and means for associating supporting evidence provided by the user with each answer.
